It is suitable for small, relatively flat areas and includes plotting by triangulation and traversing methods. What are the types of errors in surveying discussed in BC Punmia? Errors in surveying are classified as gross errors, systematic errors, and accidental errors. Gross errors are large, often due to mistakes; systematic errors are consistent and can be corrected; accidental errors are random and minimized through precise methods. What is the significance of the 'closing error' in traversing as per BC Punmia? Closing error is the difference between the computed and actual measured positions in a traverse. Its significance lies in assessing the accuracy of the survey; a smaller closing error indicates higher accuracy. How do you determine the area of a plot using the method of triangulation as explained in BC Punmia? The area is calculated by dividing the plot into triangles, measuring their sides and angles, and then applying formulas like the sine rule or Heron's formula to find the area of each triangle, summing up for the total area.
