Common Types of Physics Questions on Kennywood Physics Day

Types of Questions and Their Focus Areas

The questions asked during Kennywood Physics Day are designed to test understanding of core physics concepts through practical scenarios. These questions often involve calculations or explanations related to:

- Speed and velocity of rides
- Forces acting on riders and rides (e.g., centripetal force, gravity)
- Energy transformations (potential to kinetic energy)
- Acceleration and deceleration of rides
- Impact of mass and weight on ride dynamics
- Friction and its effects on motion

Sample Questions and Their Answers

Below are some typical questions you might encounter during Kennywood Physics Day, along with detailed solutions and explanations:

Question 1: How does the acceleration of a roller coaster relate to its speed and track curvature?

Answer: The acceleration of a roller coaster depends on both its speed and the curvature of the track. When a coaster moves along a curved track, it experiences centripetal acceleration given by the formula:

$$a = v^2 / r$$

- v = velocity (speed)
- r = radius of curvature

This means that at higher speeds or tighter curves (smaller radius r), the acceleration increases, leading to a feeling of increased "g-force" experienced by riders.

Question 2: If a ride has a mass of 500 kg and reaches a speed of 20 m/s at the bottom of a drop, what is the kinetic energy?

Answer: Kinetic energy (KE) is calculated using the formula:

$$KE = \frac{1}{2} m v^2$$

Substituting the values:

$$KE = \frac{1}{2} \times 500 \text{ kg} \times (20 \text{ m/s})^2 = 0.5 \times 500 \times 400 = 100,000 \text{ Joules}$$

This energy represents the amount of work required to bring the ride to that speed or the energy released during the descent.

Question 3: Why do riders feel heavier at the bottom of a drop?

Answer: Riders feel heavier at the bottom because of increased apparent weight due to the combination of gravitational force and the upward normal force exerted by the seat. When the coaster accelerates downward and then rapidly changes direction, the normal force exceeds the rider's weight, resulting in a sensation of increased "g-force" or heaviness.
