Sample Problems and Solutions

Practicing with real problems is essential. Here are a few representative problems from Unit 12, along with brief solutions:

Problem 1: Factoring a Polynomial

Factor the polynomial $(x^3 - 6x^2 + 11x - 6)$.

Solution:

- Try rational root theorem to find possible roots: factors of constant term 6 over factors of leading coefficient 1.
- Possible roots: $\pm 1, \pm 2, \pm 3, \pm 6$.
- Test $(x=1)$: $(1 - 6 + 11 - 6 = 0)$, so $(x=1)$ is a root.
- Divide the polynomial by $(x-1)$: using synthetic division.
- Resulting quadratic: $(x^2 - 5x + 6)$.
- Factor further: $(x-2)(x-3)$.
- Final factorization: $(x-1)(x-2)(x-3)$.

Problem 2: Solving an Exponential Equation

Solve for (x) : $(3^{2x+1} = 81)$.

Solution:

- Rewrite 81 as a power of 3: $(81 = 3^4)$.
- Set exponents equal: $(2x + 1 = 4)$.
- Solve for (x) : $(2x = 3)$, so $(x = \frac{3}{2})$.

Problem 3: Simplifying a Logarithmic Expression

Simplify $(\log_2 8 + \log_2 4)$.

Solution:

- Use the product rule: $\log_b A + \log_b B = \log_b (A \times B)$.
- Combine: $\log_2 (8 \times 4) = \log_2 32$.
- Simplify: $\log_2 32 = 5$, because $2^5 = 32$.
