Understanding Dilation in Geometry

Dilation is one of the four basic transformations in geometry, alongside translation, rotation, and reflection. It involves resizing a figure relative to a fixed point called the center of dilation. The size change is determined by the scale factor.

Key Concepts of Dilation

- **Center of Dilation:** The fixed point about which the figure is enlarged or reduced.
- **Scale Factor:** The ratio of the image's size to the original figure's size. A scale factor greater than 1 results in an enlargement, while a scale factor between 0 and 1 causes a reduction.
- **Image of a Dilation:** The resulting figure after applying the dilation transformation.

Dilation preserves the shape of the figure but not necessarily the size, making similar figures a

critical concept linked to dilation.

Problem 1: Identifying the Center of Dilation

Given a figure and its image after dilation, identify the point about which the figure was dilated.

Solution Approach:

- Examine the figure and image.
- Use the distances and lines to locate the fixed point.
- Verify that all points are scaled proportionally from this point.

Problem 2: Calculating the Scale Factor

A triangle with vertices at A(2, 3), B(4, 7), and C(6, 3) is dilated to form a new triangle with vertices A'(4, 6), B'(8, 14), and C'(12, 6). Find the scale factor of the dilation.

Solution:

- Determine the ratio of corresponding points.
- For example, compare A and A': scale factor = distance from the center to A' divided by distance to A, or directly compare coordinates if the center is known.
- Final answer: scale factor = 2.

Problem 3: Performing Dilation with Coordinates

Given point P(3, 4) and center of dilation at C(1, 2), perform a dilation with a scale factor of 3. Find the coordinates of the image P'.

Solution:

- Use the dilation formula: $P' = C + k(P - C)$
- Calculation:
 - $P - C = (3 - 1, 4 - 2) = (2, 2)$
 - Multiply by scale factor $k=3$: (6, 6)
 - Add back C: $(1 + 6, 2 + 6) = (7, 8)$

Answer: P'(7, 8)
