Objectives of Saxon Math 7th Grade Lesson 72

Before diving into specifics, it's important to understand what Lesson 72 aims to accomplish:

- Reinforce understanding of algebraic expressions and their simplification
- Introduce solving multi-step linear equations
- Develop skills in translating word problems into algebraic equations
- Enhance problem-solving strategies using algebraic methods
- Prepare students for more advanced algebra topics in subsequent lessons

Key Concepts Covered in Lesson 72

Lesson 72 builds upon previous lessons by delving into more complex algebraic techniques. Below are the core concepts addressed:

1. Simplifying Algebraic Expressions

Students learn to combine like terms, distribute, and factor expressions to simplify them effectively.

2. Solving Multi-step Equations

This includes:

- Isolating variables through inverse operations

- Managing equations with variables on both sides
- Handling equations involving parentheses and fractions

3. Word Problems and Translating to Algebra

Transforming real-world scenarios into algebraic equations is a key focus, enhancing practical problem-solving skills.

4. Application of Algebra in Real-Life Contexts

Students practice applying algebraic techniques to scenarios such as budgeting, distances, and rates.

Step-by-Step Breakdown of Lesson 72

Understanding the flow of Lesson 72 can help clarify the learning process. Here's a detailed breakdown:

Step 1: Review of Prior Knowledge

The lesson begins with a quick review of basic algebraic properties, including the distributive property, combining like terms, and solving simple equations. This ensures students are prepared for more complex problems.

Step 2: Introduction to Multi-step Equations

The teacher introduces multi-step equations, demonstrating methods to solve for the variable:

- Eliminate parentheses using distribution
- Combine like terms on both sides of the equation
- Use inverse operations to isolate the variable

Example:

Solve for x :

$$3(2x + 4) - 5 = 2(x + 3) + 7$$

$$3(2x + 4) - 5 = 2(x + 3) + 7$$

$\backslash$

Solution steps:

- Distribute:

 $\backslash$

$$6x + 12 - 5 = 2x + 6 + 7$$

 $\backslash$

- Combine like terms:

 $\backslash$

$$6x + 7 = 2x + 13$$

 $\backslash$

- Subtract $\backslash(2x \backslash)$ from both sides:

 $\backslash$

$$4x + 7 = 13$$

 $\backslash$

- Subtract 7 from both sides:

 $\backslash$

$$4x = 6$$

 $\backslash$

- Divide both sides by 4:

 $\backslash$

$$x = \frac{6}{4} = \frac{3}{2}$$

 $\backslash$

Step 3: Word Problem Practice

Students practice translating word problems into algebraic equations. For example:

Problem: A rectangle has a length that is 3 meters longer than its width. If the perimeter is 22 meters, find the length and width.

Solution:

- Let w represent the width.
- Then, length $l = w + 3$.
- Perimeter $P = 2l + 2w = 22$.

Substitute l :

[

$$2(w + 3) + 2w = 22$$

]

Simplify:

[

$$2w + 6 + 2w = 22$$

]

Combine like terms:

[

$$4w + 6 = 22$$

]

Subtract 6:

[

$$4w = 16$$

\]

Divide by 4:

\[

$$w = 4$$

\]

Find \(\ell\):

\[

$$\ell = 4 + 3 = 7$$

\]

Answer: Width = 4 meters, Length = 7 meters.
