- Simple distillation: Suitable when boiling points differ significantly, or when impurities have much higher boiling points.
- Fractional distillation: Uses a fractionating column to improve separation, especially useful for close boiling point mixtures.

Factors Affecting Distillation Efficiency

- Reflux ratio: The ratio of condensed vapor returned to the distillation flask, influencing purity.
- Column packing: Material used in the fractionating column impacts separation efficiency.
- Heating rate: Controlled heating prevents bumping and ensures steady distillation.

Experimental Setup and Procedure

Apparatus Used

- Distillation flask: Usually a round-bottom flask.
- Thermometer: To monitor temperature at the vapor exit.
- Fractionating column: Packed or unpacked, depending on the setup.
- Condenser: To cool vapor and condense it back to liquid.
