Analyzing Typical Questions and Solutions

Understanding the structure of common exam questions is crucial. Here, we analyze some typical questions found in the IPC Physics Final Review 2, along with detailed solutions from the answer key.

Electromagnetism Questions

Question:

A solenoid with 500 turns is wrapped around a steel core. When a current of 2 A passes through the solenoid, what is the magnetic field inside the solenoid? Assume the length of the solenoid is 0.5 meters.

Solution:

Using the formula for magnetic field inside a solenoid:

$$B = \mu_0 \mu_r \frac{N}{L} I$$

Where:

- $\mu_0 = 4\pi \times 10^{-7} \text{ T} \cdot \text{m/A}$ (permeability of free space)
- μ_r (relative permeability of steel, approximately 1000)
- $N = 500$ turns
- $L = 0.5 \text{ m}$ (length of solenoid)
- $I = 2 \text{ A}$

Calculations:

$$B = (4\pi \times 10^{-7}) \times 1000 \times \frac{500}{0.5} \times 2$$

$$B = (4\pi \times 10^{-7}) \times 1000 \times 1000 \times 2$$

$$B = (4\pi \times 10^{-7}) \times 2 \times 10^6$$

$$B \approx (12.566 \times 10^{-7}) \times 2 \times 10^6$$

$$B \approx 12.566 \times 10^{-7} \times 2 \times 10^6$$

$$B \approx 25.132 \times 10^{-1}$$

$$B \approx 2.513 \, \text{T}$$

Answer:

The magnetic field inside the solenoid is approximately 2.51 Tesla.

This question exemplifies how the answer key provides step-by-step calculations, allowing students to understand the underlying principles.

Waves and Optics Questions

Question:

A wave traveling along a string has a wavelength of 0.5 meters and a frequency of 20 Hz. What is its wave speed?

Solution:

Wave speed (v) is related to wavelength (λ) and frequency (f) by:

$$v = \lambda \times f$$

Calculations:

$$v = 0.5 \, \text{m} \times 20 \, \text{Hz}$$

$$v = 10 \, \text{m/s}$$

Answer:

The wave travels at 10 meters per second.

The answer key emphasizes understanding the fundamental wave equation, which is crucial for solving similar problems.

Modern Physics Questions

Question:

Explain how the photoelectric effect demonstrates the particle nature of light.

Solution:

The photoelectric effect shows that light can eject electrons from a metal surface only if the incident light has a minimum frequency, regardless of its intensity. This suggests that light consists of particles called photons, each with energy $E = hf$, where h is Planck's constant and f is the frequency. When photons strike the metal, they transfer their energy to electrons. If this energy exceeds the work function ϕ , electrons are emitted.

This phenomenon cannot be explained by wave theory alone, as increasing light intensity (which increases wave amplitude) does not increase the kinetic energy of emitted electrons, only the number of electrons. The particle model of light accounts for this behavior, providing evidence for quantum theory.

Answer:

Because it demonstrates that light transfers energy in quantized packets (photons), which can eject electrons only if their energy exceeds the work function, thus supporting the particle model of light.

The answer key offers comprehensive explanations that deepen conceptual understanding.
